

Langgraph Agents

Design and implement an intelligent, graph-based AI agent using **LangGraph** that demonstrates autonomous web research and data retrieval capabilities. This agent will operate as a **multi-step reasoning system** composed of interconnected functional nodes, enabling it to:

1. **Conduct intelligent web searches** using Google (via SerpAPI), to discover relevant and contextual resources such as public APIs or mock servers.
2. **Retrieve and process remote data** by sending HTTP GET requests to URLs returned by the search phase, enabling it to fetch and analyze live content from API servers.
3. **Synthesize and present information** in a human-readable format, providing the end user with useful, actionable data extracted from real web sources.
